

CMP1902M Programming Fundamentals, Assessment Item 2, 2024-2025

Learning Outcome	Criterion	Pass	2:2	2:1	1
[LO1] To understand programming basics, learn the syntax and semantics of programming, Identify, select, and apply appropriate data structures and operators in common programming solutions [LO2] To implement control flow with decisions and loops using good programming practices [LO3] To implement control flow with	C1: Implementation of Task 1. The solution achieves the specifics stated in the task . (20%)	Solutions of all the tasks successfully run. The basic functionality for both tasks is implemented. However, outputs or returned value may not be what is expected.	Solutions of all the tasks successfully run. The basic and some desired functionality is achieved. However, outputs or returned value may contain some errors.	Solutions of all the tasks successfully run. All the basic and desired functionality is achieved. However, outputs or returned value may contain minor error.	Solutions of all the tasks successfully runs. All the basic, desired, and advanced functionality is achieved. Outputs or returned value without any error.
	C2: Implementation of Task 2 basic and desired features as they are described in the Assessment Brief document. Errors are handled appropriately, multiple functions are used and coding structure is organised. (40%)	Logic of the implementation is partially correct but inefficient. A simple console implementation is presented. The application works; however, desired and advanced features are missing,	Logic of the implementation is mostly correct but inefficient. An application is presented which displays all the basic game functionality. Game state is updated correctly.	Logic of the implementation is correct but may be inefficient. An application is presented which displays all the basic and desired functionality elements. Game state can be updated correctly. All the game rules are followed. The processing of the state of the game is correct.	Logic of the implementation is correct and sufficient. An application is presented which displays all the required features and includes an implementation of all the desired functionality as described in the brief. Game status is updated correctly.
	C3: Implementation of Task 3 advanced features as they are described in the Assessment Brief. Multiple classes are created and used (30%)	Handling of erroneous input is very limited Loop, control statements and different data types may be used, however, there may be flaws in their implementation, or they may not be used correctly for the implementation. The code displays non-existent or limited commenting, sensible identifier naming.	Erroneous input is mostly handled. The code displays some commenting, sensible identifier naming and some exception handling and/or error handling. Loop, control and appropriate data structures are used in the code. Multiple methods are linked together.	Game runs successfully from start to finish. The code displays effective commenting, identifier naming and exception handling. Loop, control and appropriate data structures are used in the code. Multiple methods are linked efficiently. There may exist some effort to implement classes The code displays some commenting, sensible identifier naming and some exception handling and/or error handling. Some effort to follow the PEP8 style	At least two features of the advanced game functionality are implemented. Game runs successfully from start to finish. The code is organised and written well and displays effective commenting, identifier naming and exception handling. It follows the PEP8 style Loop, control, and appropriate data structures are used in the code. Multiple methods and classes are linked together well
	C4: Coding practice and PEP8 standards. Good coding practice including appropriate header comments and inline comments describing how segments of code work; comments follow PEP8; sensible naming conventions; keeping code simple; and following the guidelines of Brief. (10%)
